

Lessons learned from the airline industry about critical maintenance

Southwest outage cost up to \$82 million

Delta estimates outage cost of \$100 million

Airlines take great pains to make sure that their planes are appropriately maintained and their proper operation is constantly verified. For obvious reasons an equipment failure in an airplane could lead to a loss of consumer confidence, prevention of normal operations and serious federal penalties and scrutiny.

It has recently become clear that airlines are not paying the same amount of attention to their data center infrastructure that they do to their planes. Unfortunately, they discovered that an equipment failure in their data center facilities can lead to hundreds of planes being grounded much more easily than an equipment failure in gear on a plane.

It happened to Southwest and Delta, it can happen at your facility.

Panoptic Solutions LLC has developed and executed "aircraft grade" custom maintenance packages in data center facilities which have identified and remediated the kinds of issues which brought down the Delta Airlines data center.

We can work with you to develop and execute a proactive maintenance plan that is right for your organization to ensure your data center doesn't "go down in flames" and take your whole business with it.
